Taper current charging circuit Taper current charging characteristics for this type of basically unregulated charger OVERCHARGING A LEAD ACID BATTERY As a result of too high a charge voltage excessive current will flow into the battery, after reaching full charge, causing decomposition of water in the electrolyte and premature aging. BATTERY TEMPERATURE COMPENSATION Power Sonic sealed lead acid batteries perform well both at low and high temperatures. At high rates of overcharge a battery will progressively heat up. When designing a taper charger always consider power voltage fluctuations. Inaccurate voltage settings can cause either over-charge or under-charge. Batteries which are stored in a discharged state, or left on the shelf for too long, may initially appear to be “open circuited” or will accept far less current than normal. The recommended constant float voltage is 2.25 – 2.30 volts per cell. Following incorrect charging procedures or using inadequate charging equipment can result in decreased battery life and/or poor battery performance. Charge time and charge quantity can easily be calculated, however an expensive circuit is necessary to obtain a highly accurate constant current. It is always important to match your charger to deliver the correct current and voltage for the battery you are charging. The selection of a suitable SLA battery charger and the methods used to charge it is just as important as choosing the right battery for the application. This allows top-off charging at currents less than C/10. During charge, the lead sulfate of the positive plate becomes lead dioxide. LTspice® is a powerful, fast and free simulation software, schematic capture and waveform viewer with enhancements and models for improving the simulation of analog circuits. For example, you wouldn’t use a 24V charger to charge a 12V battery. When the LT3652HV is powered by a solar panel, the input regulation loop is used to maintain the panel at peak output power. The part selected will carry over to your cart on this site once logged in. Sampling: Selecting the Sample button above will redirect to the third-party ADI Sample Site. Constant voltage charging circuit Constant voltage charging characteristics CONSTANT CURRENT CHARGING Constant current charging is suited for applications where discharged ampere-hours of the preceding discharge cycle are known. When, at a charge voltage of 2.45 ± 0.05 volts/cell, the current accepted by the battery drops to less than 0.01 x C amps (1% of rated capacity), the battery is fully charged and the charger should be disconnected or switched to a float voltage of 2.25 to 2.30 volts/cell. When connecting batteries in parallel, the current from a charger will tend to divide almost equally between the batteries.
